

PROMPT: ChatGPT attacks the spine (pipeline step 3)

Attach episode-1-spine-four-keys-v1.2.pdf only. Do not attach the premise; it is closed. Paste the block below.

You are the adversarial auditor for a true-crime narrative. Attached is the spine for an episode: a dated reconstruction, an access ledger with a recipient column, an earliest-action sweep, two chosen objects, eight Havenbay process rulings (all taken; treat them as the world's rules, not as claims to attack), and a pre-flight. The premise it implements has already survived two rounds of your attack and is closed; do not reopen it. Attack the graph.

Rules of the audit. Every finding names a row, a day, and a person. A finding that says "someone would" must say who, what they lawfully hold on that day, whom they take it to, and what that recipient's first mandatory action is. Rank findings by confidence. For each, state what would have to be true for the finding to be wrong. Return REWORK, KILL or PASS.

Attack in this order.

1. The sweep, Part C. Recompute every person's earliest competent action from the ledger rows combined, ignoring the author's tables. Two locks are declared thin: Margo, Days 47 to 53 (C5), and Ruby's open route from Day 27 (C4). Break them if you can. Then look for the node the author did not list.
2. The recipient column. For every row in Part B where the recipient is Del or the coroner's officer, check that the stated response is the recipient's earliest, not the outcome the story wants. Latency is suppression.
3. The residue, B7. Which residue would a competent review reach on Days 54 to 56, and on Days 222 to 262, without an offence being alleged? Rulings 5 and 7 are now settled; attack under them and say whether they are reasonable rules.
4. The swap window, Days 14 to 19. Can the letter in D3 be written in three days by a man with one handwriting sample plus seven years of her layouts, at her bench, with her pen, and pass an examination against four genuine letters? What residue does that leave that B7 does not list?
5. The objects, Part D. Does the panel do the load-bearing pair (damning only combined; recognisable to Brad alone as something he must remove)? Does the brush's false meaning fail only on the money, or is there a second point of failure that a room of three would find before Day 44?
6. Brad's journey, A4 and C2. Four hundred miles each way on cash, a nineteen-mile walk each way, a meeting at 23:00 and a train at 05:47. Put it on a real clock and say where it breaks.
7. Causal order, C9. Check the dates yourself.
8. Objection 5: the leak at Day -75 is the one accident. Is it a coincidence wearing a coat?
9. The lodger, Day -1100 (A1, B1 rows 10a and 10b, B7 R6). A low-risk missing-person file in the same precinct names Brad's flat as a lodger's last address three years before Violet. On Day 54 a new missing-person file opens on Brad Collins at that address. On Day 222 the proper look finds both. State the first mandatory action of the officer who sees two missing men from one flat, and whether it is really nothing.

Do not propose prose. Do not propose a new premise. Do not say "the police would investigate" without naming the officer's first mandatory action and its date.
