

ChatGPT attacks the structure v2.0 (five fronts)

Received 2026-09-01, verbatim except that the two LaTeX display blocks are rendered as plain arithmetic lines. Attachment was the structure v2.0 pdf; the prompt was the five-front version including the agency gate added after the critical review. **Verdict: REWORK on all five fronts, eight findings.** Disposition per finding below; repairs land in structure v2.1.

Status

#	Finding	Severity	Status	Disposition
1	The E4 turn census is materially false: 6 of 18 marked turns fail, 5 texture packages actually turn, chapter 9 has no valid marked turn, and E5's self-diagnosis missed it	Critical	Accepted	Mechanical, Claude's: relabel the census around the turns actually delivered (ch9's turn = fk_p09_05), align chapter 1 labels with the Part D boundaries, redo the pacing analysis on the corrected census
2	E3's tap consequence is arithmetically impossible (1,210 exceeds the worst-case ceiling of ~1,198) and mixes gross taps with net energy; neither the session count nor "12 tanks" is demonstrated	Critical	Accepted	Claude's: per-family gross-tap computation at the tuned yields (A/F 1.3355, R 1.7427, D 1.6975 T1eq per tap), one consistent return assumption to net energy, chapter-by-chapter session estimate recomputed before any one-sitting-per-chapter claim. CC column relabelled as rounded (6,883 vs 6,880 reconciled)
3	Chapter 1 violates the within-chapter size-mix ruling: ten single-card packages	Major	Accepted	Claude's: split fk_p01_07 into two lower-tier cards at identical T1eq, per the finding's own repair
4	fk_p07_10 is low-mass but not quick: four fulfilments for 9 T1eq	Moderate	Accepted	Claude's: one A4 card at 8 T1eq, the remaining 1 T1eq to fk_p07_09; chapter mass unchanged
5	The Part D cuts contradict the chapter 1 beat table: the accusation lands on p01_05 while p01_04 claims the turn; p01_09's police conclusion is narrated before its board work	Major	Accepted	Claude proposes the recut (accusation on p01_04's completion; p01_09 board-first, Del interprets rather than repeats); the cut boundaries remain Stephen's F4 ruling
6	fk_p01_02 is the cold-install abandonment point: biography before the case question; the keys cannot wait for the fourth completed package	Major	Accepted	Folded into the same recut: first tap stays at 12 to 15 seconds, accident ruling and keys pulled into the next package cycle (keys by roughly 0:45). Goes to Stephen with F3/F4
7	Zero compliant decisions: all four use the same package graph; D1/D2/D4 have no mapped branch consequence beyond dialogue; D3 is narratively consequential but mechanically cosmetic. Confirms the critical reviewer's agency kill-gate finding with per-decision evidence	Critical	Ruling required	GPT's repair: fork D3's play in chapter 7 (mutually exclusive branch versions of fk_p07_01/02, rejoining at 03) and fork the close on D4 (branch-specific fk_p10_08 to 10), equal mass per branch, arrest and dates unchanged; D1/D2 stay lower-order once their promised consequences are mapped to real rows. Stephen rules whether to adopt
8	The unruled close can carry one divergent decision, not the whole agency requirement; close-only agency would recreate the forbidden single end-gate	Critical	Ruling required	Same ruling as 7: D3 fork + D4/F2 fork together; converge on the arrest, never on the route and the record

Reading of the whole: the structure's arithmetic honesty held (front 2's tables recompute), its self-diagnosis did not (fronts 1 and 5), and the agency gate fails exactly as the overnight critical review predicted. Every repair keeps the spine untouched and the 1,600 envelope intact.

Overall verdict: REWORK

Front 1: Beat census, REWORK

Chapter	Marked turn test
1	fk_p01_04 fails. Before: Violet's death is an accident. Delivered at the Part D boundary: keys and a handwritten letter exist. After: the player knows only that Violet arranged something. The prediction arrives in fk_p01_05 , which is wrongly marked texture. fk_p01_09 fails because the narration already says police examined the letters and found nothing; the A4 build merely tickets Del repeating that result. fk_p01_07 is another unmarked turn: Violet moves from "I think" to "I know."
2	fk_p02_03 passes. Before: any friend may be responsible. Delivered: the meetings repeatedly make the letter lean toward Liam. After: Liam is the group's working suspect. fk_p02_08 fails. The covering slip verifies when the first letter was lodged, but the player already believes Violet feared murder before her death. It confirms provenance rather than changing belief.
3	fk_p03_02 passes. Before: the motive is undefined. Delivered: Violet was collecting money for a legal fight. After: financial benefit becomes a live motive class. fk_p03_06 passes. Before: the cupboard object is shapeless. Delivered: Violet carried a gold object around town asking whose hand made it. After: the hidden material has a form and an unknown maker. fk_p03_09 fails. One distant town listening is unexplained attention, not a changed belief.
4	fk_p04_06 passes. Before: the second letter may accurately describe Liam. Delivered: every allegation is innocent or impossible to disprove. After: the letter appears constructed to fit him. fk_p04_09 passes. Before: Brad entered the arrangement with everyone else. Delivered: he visited the cage three days early. After: Brad had prior access.
5	fk_p05_06 passes. Before: the lane witness may have seen Liam. Delivered: the witness's description does not fit Liam's build. After: Liam no longer fits the physical sighting.
6	fk_p06_06 passes. Before: Margo's interpretation is unknown. Delivered: her dated message says the cupboard object's meaning was wrong. After: Margo independently rejected the group's reading. fk_p06_08 passes. Before: the object may merely have been misunderstood. Delivered: it is absent from the cage, boxes and estate. After: a different real object existed and is missing.
7	fk_p07_07 passes. Before: the second letter is probably Violet's but strangely certain. Delivered: its certainty, selective kindness and inaccessible handwriting source converge. After: the second letter is probably forged.
8	fk_p08_01 passes. Before: Brad may have forged one letter. Delivered: another man disappeared after drinking at Brad's home. After: Brad acquires a possible earlier victim. fk_p08_05 passes. Before: Brad's disappearance may be genuine. Delivered: someone left Kestrel Head on the first train. After: a staged disappearance becomes physically possible. fk_p08_09 is an unmarked turn: before it, an unidentified man may have escaped; after Ally writes that she has stopped saying "was," Brad's survival becomes her operative belief.
9	fk_p09_08 fails. Before: the panel is unique and reconstructable. Delivered: its description is assembled for broadcast. After: the player still believes exactly what they believed before. Broadcasting is consequential action, not a belief turn. fk_p09_05 is the chapter's real unmarked turn: the player knows Brad was a signwriter, then learns Violet could not place the panel's hand. The panel begins pointing toward Brad as its maker.
10	fk_p10_01 passes. Before: Brad may have escaped. Delivered: a landlady connects his habits, the pale wall gap and an address. After: Brad is alive at a known location. fk_p10_07 fails. The arrest confirms p10_01 rather than changing belief. fk_p10_09 is an unmarked turn: Margo changes from frightened dissenter to the only friend who interpreted the substitution correctly.

Finding 1, critical: E4's turn census is materially false

Rows attacked: E4; fk_p01_04, fk_p01_05, fk_p01_07, fk_p01_09, fk_p02_08, fk_p03_09, fk_p08_09, fk_p09_05, fk_p09_08, fk_p10_07 and fk_p10_09.

Six of the 18 marked turns fail the document's own standard. Five texture packages perform genuine belief turns. Chapter 9 has no valid marked turn.

Part E5's self-diagnosis is not honest enough. Its three named weak beats are expendable texture problems. It misses the larger pacing error that the census assigns turns to the wrong packages.

Required repair: relabel the census around the turns actually delivered. Chapter 9's turn must be fk_p09_05 or another package that adds new information. Align Chapter 1's beat labels with the Part D VO boundaries.

Front 2: Economy conformance, REWORK

The Part B arithmetic recomputes correctly:

Chapter	Cards	T1eq	Assigned CC
1	10	35	150
2	15	70	300
3	20	105	450
4	21	135	580
5	24	170	730
6	23	205	880
7	27	215	925
8	25	220	945
9	26	220	945
10	32	225	975
Total	223	1,600	6,880

Exact CC at 4.3 per T1eq is 6,880. The independently rounded chapter figures in E1's final column sum to 6,883, so that column needs to be labelled as rounded estimates or corrected to reconcile.

The 223-card result does not create a former-style wall. The heaviest packages are:

- fk_p09_08: 56 T1eq across four cards
- fk_p08_09: 52 across five
- fk_p10_04: 44 across five
- fk_p06_08: 40 across three

The structure therefore keeps mass distributed across packages, but not as widely across cards as the 250-card model claimed. fk_p06_08 and fk_p09_08 are the specific packages most likely to feel like concentrated builds. They remain tuning risks rather than structural walls.

Finding 2, critical: E3's tap consequence is arithmetically impossible

Row attacked: E3, family-mix finding.

A+F is correctly calculated at 1,007 T1eq, or 62.94 per cent.

At the stated lab yield of 1.3355 T1eq per tap: 1,007 divided by 1.3355 is approximately 754 taps.

If 1.3355 is the worst of the three generator yields, the entire episode cannot require more than: 1,600 divided by 1.3355, approximately 1,198 taps.

The claimed 1,210 taps therefore contradicts E3's premise.

The comparison against 1,032 also mixes units. The 1,032 figure is net energy, not gross taps. The model's measured 233 taps for 330 T1eq implies approximately 1,130 gross taps for 1,600 T1eq.

Consequently, neither "12 free session-tanks" nor "10 to 12 sessions" has been demonstrated. Gross taps cannot be divided directly by the 100-energy tank while the baseline uses net energy after returns.

Required repair: calculate gross taps separately for A, F, R and D using their actual yields, then convert gross taps to net energy using one consistent return assumption. Recompute chapter session estimates before the structure claims one sitting per chapter. Naming this for a later tuning pass is not adequate because the current chapter pacing relies on the result.

Front 3: Variety evidence, REWORK

Exact sequences:

Chapter	Package sizes	T1eq sequence
1	1,1,1,1,1,1,1,1,1,1	1,2,2,2,4,4,4,4,8,4
2	1,2,2,1,1,3,1,2,1,1	2,4,8,6,4,16,8,10,8,4
3	1,2,2,1,3,2,2,3,1,3	4,12,6,8,8,16,12,11,16,12
4	2,1,2,2,2,2,1,3,3,3	8,8,12,8,12,24,8,14,28,13
5	2,2,1,2,3,3,3,3,2,3	8,12,8,8,24,32,14,24,12,28
6	3,2,2,2,1,3,2,3,3,2	13,20,16,12,8,28,24,40,20,24
7	3,2,2,2,2,3,3,2,4,4	16,20,24,16,20,18,36,20,36,9
8	2,5,2,1,2,3,2,2,5,1	24,40,12,4,24,28,12,20,52,4
9	3,2,2,2,2,1,3,4,3,4	20,16,12,24,12,4,16,56,32,28
10	2,3,1,5,4,1,3,5,3,5	24,14,2,44,19,4,28,36,16,38

No chapter is monotonic by T1eq. Chapters 2 through 10 are non-monotonic by package size.

Chapter 2's fk_p02_06 is a genuine local spike at 16 T1eq, against 4 immediately before it and 8 immediately after it.

Late quick wins register in Chapters 8, 9 and 10:

- Chapter 8: fk_p08_04 and fk_p08_10, both 4 T1eq singletons
- Chapter 9: fk_p09_06, a 4 T1eq singleton
- Chapter 10: fk_p10_03 at 2 and fk_p10_06 at 4

They are not merely token across the final three chapters. Chapter 7 is the exception.

Finding 3, major: Chapter 1 violates the within-chapter size-mix ruling

Rows attacked: E2 and fk_p01_01 through fk_p01_10.

All ten packages contain one card. Tiers vary, but package size does not.

Required repair: split fk_p01_07 into two lower-tier cards at identical T1eq. Opening the door and examining the second letter already support a two-card package without changing the story or chapter mass.

Finding 4, moderate: Chapter 7's claimed quick win is not quick in interaction terms

Rows attacked: E2 and fk_p07_10.

fk_p07_10 costs only 9 T1eq but requires four separate card fulfilments. It is low-mass, not quick.

Required repair: make fk_p07_10 one A4 card at 8 T1eq and move the remaining 1 T1eq into fk_p07_09. Chapter mass remains 215 while the quick win becomes real.

Front 4: Chapter 1 pacing, REWORK

Package	Boundary verdict
fk_p01_01	Coherent orientation and death line.
fk_p01_02	Coherent by itself, but dangerous for retention because it supplies biography before the case question.
fk_p01_03	Coherent accepted-account beat.
fk_p01_04	Incomplete. It ends before the letter's warning, so it cannot deliver the turn claimed in Part B.
fk_p01_05	Coherent but incorrectly classified. It contains the accusation and performs the actual turn.
fk_p01_06	Coherent, though it contains both the police instruction and the four-person pact.
fk_p01_07	Coherent and itself a belief turn.
fk_p01_08	Coherent disappearance sequence.
fk_p01_09	Overloaded. It carries the police result, mutual suspicion, Ruby's consent status, Liam's refusal and a Del scene.
fk_p01_10	Coherent closing question and sign-off.

The ten-way cut does not destroy comprehension by itself. The failure is alignment: packages p01_04 and p01_09 do not deliver the turns assigned to them.

A first interaction at 12 to 15 seconds is preferable to making a cold installer listen passively for 35 to 40 seconds. The narration continuing between merges removes the usual argument for delaying the first tap.

The retention problem occurs after that tap. The keys do not arrive until approximately 1:10, after three completed packages.

Finding 5, major: the Part D cuts contradict the Chapter 1 beat table

Rows attacked: fk_p01_04, fk_p01_05 and fk_p01_09.

The accusation that makes p01_04 a turn is assigned to p01_05. The police conclusion that makes p01_09 a turn is stated in narration before Del's scene, leaving the board as a toll booth.

Required repair: recut p01_02 through p01_05 so the accusation lands on p01_04's completion. Begin p01_09's police conclusion only after its board requirement has been fulfilled. Del may interpret that conclusion but cannot repeat information already delivered.

Finding 6, major: fk_p01_02 is the cold-install abandonment point

Row attacked: fk_p01_02 and the Part D timeline.

After hearing that Violet died, the player completes a second tutorial package for career texture while the contradiction remains two more packages away. A bored installer has no live question yet.

Required repair: keep the first tap at 12 to 15 seconds, but bring the accident ruling and the arrival of the keys into the next package cycle. The keys cannot wait for the fourth completed package.

Front 5: Agency gate, REWORK

Decision audit

Decision	Observable branch difference	Delay	Would the player know their choice mattered?	Verdict
D1, fk_p02_03	Part C promises whole-letter publication versus verified extracts. fk_p02_10 can vary its lines. A garbled leak is promised on the held branch, but no Part B package contains that leak, different art, different requirements or its cost to Ruby.	Immediate wording at p02_10, seven packages later. The later leak is unplaced.	The player sees different publication wording but no durable consequence. They could not infer what the other branch changed because the claimed later effect never enters the package table.	Cosmetic as structured.
D2, fk_p04_09	Raw handover to Del versus recording Bay 3 before handover. Part C claims Liam goes quiet until Day 311 on the market branch. No package row contains a branch-specific Liam absence, return, board task or payoff. p04_10 remains the same package and the mainline thereafter is identical.	One package to p04_10. The claimed return is about 22 packages later, but is not assigned to a row.	The player may hear a changed line immediately. Nothing later proves that the decision altered play.	Cosmetic as structured.
D3, fk_p06_06	Verbatim publication produces two signwriter responses; paraphrase produces one. The crack disappears from p09_03 on the paraphrase branch, and p10_10 has a different Tessa line. Requirements and package graph remain identical; Part C explicitly limits implementation to dialogue nodes and board annotations.	Five packages to p07_01; about 27 to p09_03; about 44 to p10_10.	Yes, an attentive player can notice weaker corroboration. However, they perform the same packages with the same requirements and reach the same deductions.	Narratively consequential, mechanically cosmetic.
D4, fk_p09_08	The mark is aired or withheld. p09_09 varies what airs. Part C promises "sift versus clean identification" at the close, but no Chapter 10 row defines different requirements, art, package path or named human consequence.	One package to p09_09; about 12 to p10_10.	The player hears a different broadcast but receives the same landlady message, handover, arrest, accounting and close.	Cosmetic as structured.

Finding 7, critical: none of D1 to D4 changes play

Rows attacked: Part C; fk_p02_03, fk_p02_10, fk_p04_09, fk_p04_10, fk_p06_06, fk_p07_01, fk_p09_03, fk_p09_08, fk_p09_09 and fk_p10_10.

All four decisions use the same package graph. D1, D2 and D4 have no mapped branch consequence beyond dialogue variation. D3 changes evidence wording and annotations but asks the player to fulfil the same requirements in the same order.

Under the standing ruling that agency must be integral and must change play, the episode currently has **zero compliant decisions**. Four flags do not create agency if the board behaves identically.

Required repair: create two genuine branch structures while retaining the same total package count and settled spine.

1. **D3 must fork play.** Replace fk_p07_01 and fk_p07_02 with mutually exclusive branch versions. The verbatim branch requires reconstruction of two source letters and preserves the crack. The paraphrase branch requires one source letter and a separate shielding task, with the crack unavailable. Both rejoin at fk_p07_03.

1. **D4 must fork the close.** Replace at least fk_p10_08 through fk_p10_10 with branch-specific requirements and payoff art. The aired branch must leave the panel description in the public record and visibly impose a lasting exposure cost. The held branch must preserve the source's privacy and reach the close through cleaner private identification. The arrest and dates remain unchanged.

D1 and D2 may remain lower-order decisions only after their promised consequences are assigned to actual package rows. They cannot count toward the multiple-decisions agency requirement in their present form.

Finding 8, critical: the unruléd close cannot rescue the agency gate by itself

Rows attacked: F2, D4 and fk_p10_08 through fk_p10_10.

F2 is sufficient to carry **one** genuinely divergent decision because the close's public record, protection and emotional accounting remain unruléd. It is not sufficient to carry the episode's agency requirement alone. That would recreate the forbidden single end-of-episode gate.

Required repair: use D3 as the first mechanically divergent branch and D4/F2 as the second. Each branch must alter card requirements, visible evidence and a later payoff. Both may converge on the settled arrest. What cannot converge completely is the player's route and the human record left behind.
